

Lab: Installing MISP (Malware Information Sharing Platform) on Ubuntu 22.04

 **Aim:** Install and configure MISP using the official automated script, access the web interface, create an organization, enable threat feeds, and retrieve the API key for integration.

Requirements

- Ubuntu 22.04 VM or server (with sudo access)
 - Internet connection
 - VirtualBox or any hypervisor (optional for VM setup)
-

Steps

1. Update the System

```
sudo apt-get update -y && sudo apt-get upgrade -y
```

2. Install MySQL Client (required by MISP installer)

```
sudo apt-get install mysql-client -y
```

3. Download and Run the MISP Installer

```
wget https://raw.githubusercontent.com/MISP/MISP/2.4/INSTALL/INSTALL.sh
```

```
chmod +x INSTALL.sh
```

```
./INSTALL.sh -A
```

 This script installs MISP, Apache, PHP, MariaDB, Redis, and more.

4. Configure Firewall (if UFW is enabled)

```
sudo ufw allow 80/tcp # HTTP
```

```
sudo ufw allow 443/tcp # HTTPS
```

sudo ufw status

➡ If UFW is inactive, skip this step.

5. Access the MISP Web Interface

From a browser:

http://<your-MISP-IP>

Default credentials:

- Username: admin@admin.test
- Password: admin

⚠ Change the password immediately after login.

6. Create an Organization

- Go to: Administration → Add Organisations
 - Fill in the organization name
 - Click Generate UUID, then Submit
-

7. Enable Default Threat Feeds

- Navigate to: Sync Actions → Feeds
- Click Load default feed metadata
- Select feeds and click:
 - ☒ Enable selected
 - ☒ Enable caching for selected

➡ This loads publicly available threat intelligence into your instance.

8. Retrieve Your API Key

- Go to: Administration → List Users
- Click the pencil  icon to edit the user (e.g., admin@admin.test)
- Scroll to the Authkey section
- Click Show Authkey

 This API key is needed for integrating MISP with Wazuh or other platforms.
